Art Unit: 1764

1. The following is an examiner's statement of reasons for allowance:

The invention relates to a method operating surface spinning disc reactors wherein the reactor surface onto which a first reactant is fed in the form of a thin film must have retaining surface closely spaced from the reaction surface, forming a reaction passage between the, the two surface being movable relative to one another to apply shear to the material passing between them. The passage or the space between the surface of the disc reactor and the retaining surface is a parallel surface not a circumferential surface that has been taught in Ramshaw 6,858,189. The reactor and method of using the surface reactor includes that second and third reactants, etc, are fed to the reactor surface in the form of a respective thin film which upon the feed will be subjected to continuous and uniform shear at its intersection. The construction and arrangement of the surface of the spinning disc and retaining surface which is spaced from the reactor surface provides a reaction zone between the second entry location and outlet location and through which the reactants feed to the reactor surface will pass while reacting with one another, the reactor and retaining surfaces being movable relative to one another to apply shear between them to reactant passing in the reaction passage as claimed has not been taught nor fairly suggested either singularly or in combination by the prior art.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
